

IPM – First Assignment

Good Design

The good design that I've discovered is in my daily wireless headphones.

My headphones are the Xiaomi Buds 3T Pro and when I want to listen some music, I must open its case and intuitively I know which one is the left headphone and the right one, because I can only pack them up in one way: the left headphone on the left side of the case and the same happens with the right one.

Bad Design

The bad design that I've discovered is the USB Flash Drive.

We, as computer's users, usually use USB Flash Drives when we want to store something somewhere physical. But, when it arrives the moment to insert it into our computer, we face a problem: there is a USB Flash Drive side that belongs to be upwards. Many times, we insert it the wrong way, turn it around and try to insert it again. Hopefully, we now can insert it the right way. Other times, we face a moment of frustration and spend some time trying to insert it.

My improvement suggestion is to, when the moment of production of these USB Flash Drives, to print a signal, like an arrow for example, so we can know how to insert it the right way without hesitation.
